Chain of events in creating a new note(0.4)
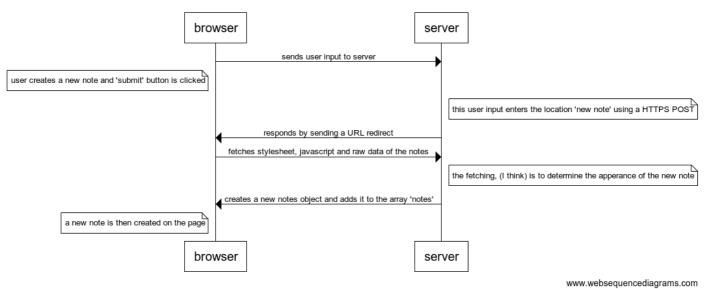

browser	server

sends user input to server →

user creates a new note and 'submit' button is clicked

this user input enters the location 'new note' using a HTTPS POST

← responds by sending a URL redirect

fetches stylesheet, javascript and raw data of the notes →

the fetching, (I think) is to determine the apperance of the new note

← creates a new notes object and adds it to the array 'notes'

a new note is then created on the page

browser	server
